Appl. No. 09/973,298 Amdt. Dated September 29, 2003 Reply to Office Action of March 28, 2003

**AMENDMENTS TO THE CLAIMS:** 

This listing of claims will replace all prior versions, and listings, of claims in the application:

**LISTING OF CLAIMS:** 

Claim 1 (Currently Amended). A mat for decreasing musculoskeletal fatigue in humans

during prolonged static postural stress comprising one or more layers of an air bubble shaped

closed cellular material and one or more layers selected from the group of materials consisting of

closed cellular polyethylene foam and closed cellular polypropylene foam materials, said air

bubble shaped closed cellular material being defined as a flat surface adapted to carry a plurality

of air chambers such that said closed cellular material comprises a flat side and a raised air

bubble side, said layers having air chambers and said polyethylene foam layer further being

dimensioned to provide said mat with a truncated pyramidal shape.

Claim 2 (Previously Presented). The mat of claim 1 wherein said air bubble shaped closed

cellular material is an anti-static air bubble shaped closed cellular material.

Claim 3 (Previously Presented). The mat of claim 1 comprising at least two layers of said

air bubble shaped closed cellular material and wherein each of said bubble layers has a flat side

and a bubble side.

Claim 4 (Previously Presented). The mat of claim 3 wherein said bubble side of one of said

layers of air bubble shaped closed cellular material is positioned to face said bubble side of

another of said layers of air bubble shaped closed cellular material.

Claim 5 (Previously Presented). The mat of claim 4 wherein a layer of said closed cellular

polyethylene foam material is interposed between said layers of air bubble shaped closed cellular

material.

Claim 6 (Previously Presented). The mat of claim 5 further comprising a base layer including a low-tack adhesive bottom surface.

Claim 7 (Previously Presented). The mat of claim 6 wherein said base layer comprises a polyethylene carrier sheet having an upper surface and a lower surface and said low-tack adhesive is carried on said lower surface of said carrier sheet.

Claim 8 (Previously Presented). The mat of claim 7 further comprising a removable liner releasably attached to the lower surface of said low-tack adhesive.

Claim 9 (Previously Presented). The mat of claim 6 further comprising a cover layer of antistatic closed cellular polypropylene foam material.

Claim 10 (Previously Presented). The mat of claim 9 wherein said layers comprising said mat are adhered together and said mat includes a laminating adhesive between said layers to adhere said layers together.

Claim 11 (Cancelled). The mat of claim 10 wherein said bubble layers and said polyethylene foam layer are between said base layer and said cover layer and said bubble layers and said polyethylene foam layer are dimensioned to provide said mat with a truncated pyramidal shape.

Claim 12 (Previously Presented). The mat of claim 8 wherein said bubble shaped material has less than a 10% thickness loss based on a 0.5 pounds per square inch loading over 15 days utilizing a static test method of 10" x 10" material samples, said closed cellular polyethylene foam material has a density of at least about 1.7 pounds per cubic foot and said polypropylene closed foam material has a density of at least about 0.5 pounds per cubic feet.

Claim 13 (Currently Amended). A disposable surgical mat comprising a first layer, a second layer over said first layer, a third layer over said second layer, and a fourth layer over said third

layer, said first layer and said third layer each composed of an anti-static air bubble shaped closed cellular material having a flat side and a bubble side, said second layer composed of an anti-static closed cellular polyethylene foam material, and said fourth layer composed of an anti-static polypropylene closed cellular foam material, said air bubble shaped closed cellular material being defined as a flat surface adapted to carry a plurality of air chambers such that said air bubble shaped closed cellular material comprises a flat side and a raised air bubble side, said layers having air chambers and said polyethylene foam layer further being dimensioned to provide said mat with a truncated pyramidal shape.

Claim 14 (Previously Presented). The mat of claim 13 wherein said bubble side of said first layer faces said second layer and said bubble side of said third layer faces said second layer.

Claim 15 (Previously Presented). The mat of claim 14 wherein said first layer is adhered to said second layer, said second layer is adhered to said third layer and said third layer is adhered to said fourth layer.

Claim 16 (Previously Presented). The mat of claim 15 wherein a laminating adhesive is interposed between said first and second layers, a laminating adhesive is interposed between said second and third layers, and a laminating adhesive is interposed between said third and fourth layers.

Claim 17 (Previously Presented). The mat of claim 16 further comprising a low-tack adhesive layer under said first layer.

Claim 18 (Previously Presented). The mat of claim 17 wherein said low-tack adhesive layer comprises an upper polyethylene carrier sheet facing said first layer, a low-tack adhesive carried on the bottom side of said carrier sheet and a removable liner releasably attached to said adhesive.

Appl. No. 09/973,298 Amdt. Dated September 29, 2003 Reply to Office Action of March 28, 2003

Claim 19 (Previously Presented). The mat of claim 17 further comprising a laminated adhesive interposed between said carrier sheet and said first layer to adhere said adhesive layer to said first layer.

Claim 20 (Previously Presented). The mat of claim 19 wherein said adhesive layer, said first layer, said second layer, said third layer and said fourth layer each has a similar shape and the dimensions of said first layer are equal to or less than the dimensions of said adhesive layer, the dimensions of said second layer are equal to or less than the dimensions of said first layer, the dimensions of said third layer are equal to or less than the dimensions of said second layer and the dimensions of said fourth layer are equal to or greater than the dimensions of said first layer.

Claim 21 (Previously Presented). The mat of claim 20 wherein each of said layers has a rectangular shape and a respective length and width, and said length and width of said first layer is less than said respective length and width of said low-tack adhesive layer, said length and width of said second layer is less than said respective length and width of said first layer, said length and width of said third layer is less than said respective length and width of said second layer, and said length and width of said fourth layer is equal to or greater than said respective length and width of said low-tack adhesive layer.

Claim 22 (Currently Amended). A disposable surgical mat for decreasing musculoskeletal fatigue in humans during prolonged static postural stress comprising a first layer, a second layer under said first layer, and a third layer under said second layer, said first layer including an anti-static closed cellular polypropylene foam material, said second layer including an anti-static closed cellular polyethylene foam material, and said third layer including a low tack adhesive material, said first, second and third layers further being dimensioned to provide said mat with a truncated pyramidal shape.

Claim 23 (Currently Amended). The mat of claim 22 further comprising a layer of an antistatic air bubble shaped closed cellular material interposed between said first layer and said second layer, said air bubble shaped closed cellular material being defined as a flat surface adapted to carry a plurality of air chambers such that said air bubble shaped closed cellular material comprises a flat side and a raised air bubble side.

Claim 24 (Previously Presented). The mat of claim 22 further comprising a layer of an antistatic air bubble shaped closed cellular material interposed between said second layer and said third layer.

Claim 25 (Currently Amended). A disposable mat comprising a closed cellular polypropylene foam material top layer, one or more layers selected from the group of materials consisting of closed cellular polyethylene foam and air bubble shaped closed cellular materials and a bottom low tack adhesive layer, said air bubble shaped closed cellular material being defined as a flat surface adapted to carry a plurality of air chambers such that said air bubble shaped closed cellular material comprises a flat side and a raised air bubble side, said layers having air chambers and said polyethylene foam layer further being dimensioned to provide said mat with a truncated pyramidal shape.

Claim 26 (Previously Presented). The mat of claim 25 wherein at least one of said one or more layers is a layer of closed cellular polyethylene foam material.

Claim 27 (Previously Presented). The mat of claim 25 wherein at least one of said one or more layers is a layer of air bubble shaped closed cellular material.

Claim 28 (Previously Presented). The mat of claim 26 wherein said at least one or more layers further includes at least one layer of air bubble shaped closed cellular material.

Claim 29 (Currently Amended). A method for decreasing musculoskeletal fatigue in humans resulting from static postural stress in a surgical theatre during open operative procedures which method also facilitates maintaining the surgical theatre in a surgically safe environment comprising the steps of: positioning a completely disposable mat <a href="https://document.com/harmonics.com/harmonic

Appl. No. 09/973,298 Amdt. Dated September 29, 2003 Reply to Office Action of March 28, 2003

comprising a layer of closed cellular polypropylene foam material and one or more layers selected from the group of materials consisting of closed cellular polyethylene foam and air bubble shaped closed cellular materials; supporting a human on said mat during a period of static postural positioning; disposing of said mat after the conclusion of the operative procedure.
